

Scan Report

October 11, 2021

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone “Coordinated Universal Time”, which is abbreviated “UTC”. The task was “metasploitable2-scan-svt”. The scan started at Mon Oct 11 22:34:38 2021 UTC and ended at Mon Oct 11 22:59:48 2021 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

1	Result Overview	2

1 Result Overview

Host	High	Medium	Low	Log	False Positive
192.168.1.125	23	36	2	0	0
Total: 1	23	36	2	0	0

Vendor security updates are not trusted.

Overrides are off. Even when a result has an override, this report uses the actual threat of the result.

Information on overrides is included in the report.

Notes are included in the report.

This report might not show details of all issues that were found.

Issues with the threat level “Log” are not shown.

Issues with the threat level “Debug” are not shown.

Issues with the threat level “False Positive” are not shown.

Only results with a minimum QoD of 70 are shown.

This report contains all 61 results selected by the filtering described above. Before filtering there were 470 results.

2.1.1 High 513/tcp

High (CVSS: 10.0)
NVT: rlogin Passwordless Login

Summary

The rlogin service allows root access without a password.

Vulnerability Detection Result

It was possible to gain root access without a password.

Impact

This vulnerability allows an attacker to gain complete control over the target system.

Solution:

Solution type: Mitigation

Disable the rlogin service and use alternatives like SSH instead.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: rlogin Passwordless Login

OID:1.3.6.1.4.1.25623.1.0.113766

Version used: 2020-09-30T09:30:12Z

High (CVSS: 7.5) NVT: The rlogin service is running
Summary This remote host is running a rlogin service.
Vulnerability Detection Result The rlogin service is running on the target system.
Solution: Solution type: Mitigation Disable the rlogin service and use alternatives like SSH instead.
Vulnerability Insight rlogin has several serious security problems, - all information, including passwords, is transmitted unencrypted. - .rlogin (or .rhosts) file is easy to misuse (potentially allowing anyone to login without a password)
Vulnerability Detection Method Details: The rlogin service is running OID:1.3.6.1.4.1.25623.1.0.901202 Version used: 2021-09-01T07:45:06Z

2.1.2 High 3632/tcp

High (CVSS: 9.3) NVT: DistCC Remote Code Execution Vulnerability
Summary DistCC 2.x, as used in XCode 1.5 and others, when not configured to restrict access to the server port, allows remote attackers to execute arbitrary commands via compilation jobs, which are executed by the server without authorization checks.
Vulnerability Detection Result It was possible to execute the "id" command. Result: uid=1(daemon) gid=1(daemon)
Impact DistCC by default trusts its clients completely that in turn could allow a malicious client to execute arbitrary commands on the server.
... continues on next page ...

...continued from previous page...

Solution:**Solution type:** VendorFix

Vendor updates are available. Please see the references for more information.

For more information about DistCC's security see the references.

[\[return to 192.168.1.125 \]](#)**2.1.3 High 1524/tcp**

High (CVSS: 10.0)

NVT: Possible Backdoor: Ingreslock

Summary

A backdoor is installed on the remote host.

Vulnerability Detection Result

The service is answering to an 'id;' command with the following response: uid=0(↵root) gid=0(root)

Impact

Attackers can exploit this issue to execute arbitrary commands in the context of the application. Successful attacks will compromise the affected isystem.

Solution:**Solution type:** Workaround

A whole cleanup of the infected system is recommended.

2.1.5 High 8787/tcp

High (CVSS: 10.0) NVT: Distributed Ruby (dRuby/DRb) Multiple Remote Code Execution Vulnerabilities
Summary Systems using Distributed Ruby (dRuby/DRb), which is available in Ruby versions 1.6 and later, may permit unauthorized systems to execute distributed commands.
Vulnerability Detection Result ... continues on next page ...

...continued from previous page...

The service is running in \$SAFE >= 1 mode. However it is still possible to run arbitrary syscall commands on the remote host. Sending an invalid syscall the service returned the following response:

```
Flo:Errno::ENOSYS:bt["3/usr/lib/ruby/1.8/drb/drb.rb:1555:in 'syscall'"0/usr/lib/
ruby/1.8/drb/drb.rb:1555:in 'send'"4/usr/lib/ruby/1.8/drb/drb.rb:1555:in '__se
nd__'"A/usr/lib/ruby/1.8/drb/drb.rb:1555:in 'perform_without_block'"3/usr/lib/
ruby/1.8/drb/drb.rb:1515:in 'perform'"5/usr/lib/ruby/1.8/drb/drb.rb:1589:in 'm
ain_loop'"0/usr/lib/ruby/1.8/drb/drb.rb:1585:in 'loop'"5/usr/lib/ruby/1.8/drb/
drb.rb:1585:in 'main_loop'"1/usr/lib/ruby/1.8/drb/drb.rb:1581:in 'start'"5/usr
/lib/ruby/1.8/drb/drb.rb:1581:in 'main_loop'"/usr/lib/ruby/1.8/drb/drb.rb:143
0:in 'run'"1/usr/lib/ruby/1.8/drb/drb.rb:1427:in 'start'"/usr/lib/ruby/1.8/dr
b/drb.rb:1427:in 'run'"6/usr/lib/ruby/1.8/drb/drb.rb:1347:in 'initialize'"/usr
/lib/ruby/1.8/drb/drb.rb:1627:in 'new'"9/usr/lib/ruby/1.8/drb/drb.rb:1627:in
'start_service'"/usr/sbin/druby_timeserver.rb:12:errno:mesg"Function not im
plemented
```

Impact

By default, Distributed Ruby does not impose restrictions on allowed hosts or set the \$SAFE environment variable to prevent privileged activities. If other controls are not in place, especially if the Distributed Ruby process runs with elevated privileges, an attacker could execute arbitrary system commands or Ruby scripts on the Distributed Ruby server. An attacker may need to know only the URI of the listening Distributed Ruby server to submit Ruby commands.

Solution:

Solution type: Mitigation

Administrators of environments that rely on Distributed Ruby should ensure that appropriate controls are in place. Code-level controls may include:

- Implementing taint on untrusted input
- Setting \$SAFE levels appropriately (>=2 is recommended if untrusted hosts are allowed to submit Ruby commands, and >=3 may be appropriate)
- Including drb/acl.rb to set ACLEntry to restrict access to trusted hosts

Vulnerability Detection Method

Send a crafted command to the service and check for a remote command execution via the instance_eval or syscall requests.

2.1.6 High 514/tcp

High (CVSS: 7.5) NVT: rsh Unencrypted Cleartext Login
Summary This remote host is running a rsh service.
Vulnerability Detection Result The rsh service is misconfigured so it is allowing connections without a password or with default root:root credentials.
Solution: Solution type: Mitigation Disable the rsh service and use alternatives like SSH instead.
Vulnerability Insight rsh (remote shell) is a command line computer program which can execute shell commands as another user, and on another computer across a computer network.
Vulnerability Detection Method Details: rsh Unencrypted Cleartext Login OID:1.3.6.1.4.1.25623.1.0.100080 Version used: 2019-01-10T07:59:14Z

2.1.7 High 512/tcp

High (CVSS: 10.0) NVT: The rexec service is running
Summary This remote host is running a rexec service.
Vulnerability Detection Result The rexec service was detected on the target system.
Solution: ... continues on next page ...

...continued from previous page ...
Solution type: Mitigation Disable the rexec service and use alternatives like SSH instead.
Vulnerability Insight rexec (remote execution client for an exec server) has the same kind of functionality that rsh has: you can execute shell commands on a remote computer. The main difference is that rexec authenticates by reading the username and password *unencrypted* from the socket.
Vulnerability Detection Method Checks if a vulnerable version is present on the target host. Details: The rexec service is running OID:1.3.6.1.4.1.25623.1.0.100111 Version used: 2020-10-01T11:33:30Z

NVT: Java RMI Server Insecure Default Configuration Remote Code Execution Vulnerability

Summary

Multiple Java products that implement the RMI Server contain a vulnerability that could allow an unauthenticated, remote attacker to execute arbitrary code on a targeted system with elevated privileges.

Vulnerability Detection Result

Vulnerability was detected according to the Vulnerability Detection Method.

Impact

An unauthenticated, remote attacker could exploit the vulnerability by transmitting crafted packets to the affected software. When the packets are processed, the attacker could execute arbitrary code on the system with elevated privileges.

Solution:

Solution type: Workaround

Disable class-loading.

Vulnerability Insight

The vulnerability exists because of an incorrect default configuration of the Remote Method Invocation (RMI) Server in the affected software.

Vulnerability Detection Method

Check if the target tries to load a Java class via a remote HTTP URL.

Details: Java RMI Server Insecure Default Configuration Remote Code Execution Vulnerabil.

Solution: Solution type: VendorFix Upgrade to version 4.2.4 or later.	
Affected Software/OS TWiki, TWiki version prior to 4.2.4.	
Vulnerability Insight The flaws are due to: - %URLPARAM}% variable is not properly sanitized which lets attackers conduct cross-site scripting attack. - %SEARCH}% variable is not properly sanitised before being used in an eval() call which lets the attackers execute perl code through eval injection attack.	
Vulnerability Detection Method Details: TWiki XSS and Command Execution Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.800320 Version used: 2021-08-10T15:24:26Z

High (CVSS: 7.5)
 NVT: Test HTTP dangerous methods

Summary
 Misconfigured web servers allows remote clients to perform dangerous HTTP methods such as PUT and DELETE.

Vulnerability Detection Result
 We could upload the following files via the PUT method at this web server:
<http://192.168.1.125/dav/puttest405673885.html>

... continues on next page ...

...continued from previous page ...
We could delete the following files via the DELETE method at this web server: <code>http://192.168.1.125/dav/puttest405673885.html</code>
Impact - Enabled PUT method: This might allow an attacker to upload and run arbitrary code on this web server. - Enabled DELETE method: This might allow an attacker to delete additional files on this web server.
Solution: Solution type: Mitigation Use access restrictions to these dangerous HTTP methods or disable them completely.
Affected Software/OS Web servers with enabled PUT and/or DELETE methods.
Vulnerability Detection Method Checks if dangerous HTTP methods such as PUT and DELETE are enabled and can be misused to upload or delete files. Details: Test HTTP dangerous methods OID:1.3.6.1.4.1.25623.1.0.10498 Version used: 2021-02-15T07:14:40Z

High (CVSS: 7.5)

NVT: PHP-CGI-based setups vulnerability when parsing query string parameters from php files.

Summary

PHP is prone to an information-disclosure vulnerability.

Vulnerability Detection Result

By doing the following HTTP POST request:

"HTTP POST" body : `<?php phpinfo();?>`

URL : `http://192.168.1.125/cgi-bin/php?%2D%64+%61%6C%6C%6F%77%5F%75%72%6C%5F%69%6E%63%6C%75%64%65%3D%6F%6E+%2D%64+%73%61%66%65%5F%6D%6F%64%65%3D%6F%66%66+%2D%64+%73%75%68%6F%73%69%6E%2E%73%69%6D%75%6C%61%74%69%6F%6E%3D%6F%6E+%2D%64+%64%69%73%61%62%6C%65%5F%66%75%6E%63%74%69%6F%6E%73%3D%22%22+%2D%64+%6F%70%65%6E%5F%62%61%73%65%64%69%72%3D%6E%6F%6E%65+%2D%64+%61%75%74%6F%5F%70%72%65%70%65%6E%64%5F%66%69%6C%65%3D%70%68%70%3A%2F%2F%69%6E%70%75%74+%2D%64+%63%67%69%2E%67%69%2E%66%6F%72%63%65%5F%72%65%64%69%72%65%63%74%3D%30+%2D%64+%63%67%69%2E%72%65%64%69%72%65%63%74%5F%73%74%61%74%75%73%5F%65%6E%76%3D%30+%2D%6E`

it was possible to execute the "`<?php phpinfo();?>`" command.Result: `<title>phpinfo()</title><meta name="ROBOTS" content="NOINDEX,NOFOLLOW,NO`

... continues on next page ...

...continued from previous page ...	
<code><ARCHIVE" /></head></code>	
Impact	Exploiting this issue allows remote attackers to view the source code of files in the context of the server process. This may allow the attacker to obtain sensitive information and to run arbitrary PHP code on the affected computer. Other attacks are also possible.
Solution:	
Solution type: VendorFix	PHP has released version 5.4.3 and 5.3.13 to address this vulnerability. PHP is recommending that users upgrade to the latest version of PHP.
Vulnerability Insight	When PHP is used in a CGI-based setup (such as Apache's mod_cgid), the php-cgi receives a processed query string parameter as command line arguments which allows command-line switches, such as -s, -d or -c to be passed to the php-cgi binary, which can be exploited to disclose source code and obtain arbitrary code execution. An example of the -s command, allowing an attacker to view the source code of index.php is below: <code>http://example.com/index.php?-s</code>
Vulnerability Detection Method	Sends a crafted HTTP POST request and checks the response. Details: PHP-CGI-based setups vulnerability when parsing query string parameters from ph. <code><..</code> OID:1.3.6.1.4.1.25623.1.0.103482 Version used: 2021-04-13T14:13:08Z

High (CVSS: 7.5)

NVT: phpinfo() output Reporting

Summary

Many PHP installation tutorials instruct the user to create a file called phpinfo.php or similar containing the phpinfo() statement. Such a file is often left back in the webserver directory.

Vulnerability Detection Result

The following files are calling the function phpinfo() which disclose potentially sensitive information:

<http://192.168.1.125/mutillidae/phpinfo.php>

<http://192.168.1.125/phpinfo.php>

Impact

Some of the information that can be gathered from this file includes:

The username of the user running the PHP process, if it is a sudo user, the IP address of the host, the web server version, the system version (Unix, Linux, Windows, ...), and the root directory of the web server.

Solution:

Solution type: Workaround

Delete the listed files or restrict access to them.

Vulnerability Detection Method

Details: phpinfo() output Reporting

OID:1.3.6.1.4.1.25623.1.0.11229

Version used: 2020-08-24T15:18:35Z

[\[return to 192.168.1.125 \]](#)

2.1.17 High 5900/tcp

High (CVSS: 9.0) NVT: VNC Brute Force Login
Summary Try to log in with given passwords via VNC protocol.
Vulnerability Detection Result It was possible to connect to the VNC server with the password: password
Solution: Solution type: Mitigation Change the password to something hard to guess or enable password protection at all.
Vulnerability Insight This script tries to authenticate to a VNC server with the passwords set in the password preference. It will also test and report if no authentication / password is required at all. Note: Some VNC servers have a blacklisting scheme that blocks IP addresses after five unsuccessful connection attempts for a period of time. The script will abort the brute force attack if it encounters that it gets blocked. Note as well that passwords can be max. 8 characters long.
Vulnerability Detection Method Details: VNC Brute Force Login OID:1.3.6.1.4.1.25623.1.0.106056 Version used: 2021-07-23T07:56:26Z

Medium (CVSS: 5.0)

NVT: SSL/TLS: Certificate Expired

Summary

The remote server's SSL/TLS certificate has already expired.

... continues on next page ...

...continued from previous page ...
Vulnerability Detection Result The certificate of the remote service expired on 2010-04-16 14:07:45. Certificate details:
Solution: Solution type: Mitigation Replace the SSL/TLS certificate by a new one.
Vulnerability Insight This script checks expiry dates of certificates associated with SSL/TLS-enabled services on the target and reports whether any have already expired.
Vulnerability Detection Method Details: SSL/TLS: Certificate Expired OID:1.3.6.1.4.1.25623.1.0.103955 Version used: 2018-08-24T10:37:26Z
Medium (CVSS: 5.0) NVT: Check if Mailserver answer to VRFY and EXPN requests
Summary The Mailserver on this host answers to VRFY and/or EXPN requests.
Vulnerability Detection Result 'VRFY root' produces the following answer: 252 2.0.0 root
Solution: Solution type: Workaround Disable VRFY and/or EXPN on your Mailserver. For postfix add 'disable_vrfy_command=yes' in 'main.cf'. For Sendmail add the option 'O PrivacyOptions=goaway'. It is suggested that, if you really want to publish this type of information, you use a mechanism that legitimate users actually know about, such as Finger or HTTP.
Vulnerability Insight VRFY and EXPN ask the server for information about an address. They are inherently unusable through firewalls, gateways, mail exchangers for part-time hosts, etc.
Vulnerability Detection Method Details: Check if Mailserver answer to VRFY and EXPN requests OID:1.3.6.1.4.1.25623.1.0.100072 Version used: 2020-08-24T08:40:10Z

Medium (CVSS: 4.3)

NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Summary

It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.

Vulnerability Detection Result

In addition to TLSv1.0+ the service is also providing the deprecated SSLv2 and SSLv3 protocols and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.256.23.1.0.802067) VT.

Impact

An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.

Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:**Solution type:** Mitigation

It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols. Please see the references for more information.

Affected Software/OS

All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.

Vulnerability Insight

The SSLv2 and SSLv3 protocols contain known cryptographic flaws like:

- CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE)
- CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)

Vulnerability Detection Method

Check the used SSL protocols of the services provided by this system.

Details: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

OID:1.3.6.1.4.1.25623.1.0.111012

Version used: 2021-07-19T08:11:48Z

Medium (CVSS: 4.3)

NVT: SSL/TLS: 'DHE_EXPORT' Man in the Middle Security Bypass Vulnerability (LogJam)

Summary

This host is accepting 'DHE_EXPORT' cipher suites and is prone to man in the middle attack.

Vulnerability Detection Result

'DHE_EXPORT' cipher suites accepted by this service via the SSLv3 protocol:

TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA

TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA

TLS_DH_anon_EXPORT_WITH_RC4_40_MD5

'DHE_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol:

TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA

TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA

TLS_DH_anon_EXPORT_WITH_RC4_40_MD5

Impact

... continues on next page ...

...continued from previous page ...
Successful exploitation will allow a man-in-the-middle attacker to downgrade the security of a TLS session to 512-bit export-grade cryptography, which is significantly weaker, allowing the attacker to more easily break the encryption and monitor or tamper with the encrypted stream.
Solution: Solution type: VendorFix - Remove support for 'DHE_EXPORT' cipher suites from the service - If running OpenSSL update to version 1.0.2b or 1.0.1n or later.
Affected Software/OS - Hosts accepting 'DHE_EXPORT' cipher suites - OpenSSL version before 1.0.2b and 1.0.1n
Vulnerability Insight Flaw is triggered when handling Diffie-Hellman key exchanges defined in the 'DHE_EXPORT' cipher suites.
Vulnerability Detection Method Check previous collected cipher suites saved in the KB. Details: SSL/TLS: 'DHE_EXPORT' Man in the Middle Security Bypass Vulnerability (LogJam) OID:1.3.6.1.4.1.25623.1.0.805188 Version used: 2020-03-31T06:57:15Z

Medium (CVSS: 4.3)

NVT: SSL/TLS: RSA Temporary Key Handling 'RSA_EXPORT' Downgrade Issue (FREAK)

Summary

This host is accepting 'RSA_EXPORT' cipher suites and is prone to man in the middle attack.

Vulnerability Detection Result

'RSA_EXPORT' cipher suites accepted by this service via the SSLv3 protocol:

TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA

TLS_RSA_EXPORT_WITH_DES40_CBC_SHA

TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5

TLS_RSA_EXPORT_WITH_RC4_40_MD5

'RSA_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol:

TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA

TLS_RSA_EXPORT_WITH_DES40_CBC_SHA

TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5

TLS_RSA_EXPORT_WITH_RC4_40_MD5

Impact

Successful exploitation will allow remote attacker to downgrade the security of a session to use 'RSA_EXPORT' cipher suites, which are significantly weaker than non-export cipher suites. This may allow a man-in-the-middle attacker to more easily break the encryption and monitor or tamper with the encrypted stream.

Solution:

Solution type: VendorFix

- Remove support for 'RSA_EXPORT' cipher suites from the service.

- If running OpenSSL update to version 0.9.8zd or 1.0.0p or 1.0.1k or later.

Affected Software/OS

- Hosts accepting 'RSA_EXPORT' cipher suites

- OpenSSL version before 0.9.8zd, 1.0.0 before 1.0.0p, and 1.0.1 before 1.0.1k.

Vulnerability Insight

Flaw is due to improper handling RSA temporary keys in a non-export RSA key exchange cipher suite.

Vulnerability Detection Method

Check previous collected cipher suites saved in the KB.

Medium (CVSS: 4.3) NVT: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability (POODLE)
Summary This host is prone to an information disclosure vulnerability.
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.
Impact Successful exploitation will allow a man-in-the-middle attackers gain access to the plain text data stream.
Solution: Solution type: Mitigation Possible Mitigations are: - Disable SSLv3 - Disable cipher suites supporting CBC cipher modes - Enable TLS_FALLBACK_SCSV if the service is providing TLSv1.0+
Vulnerability Insight The flaw is due to the block cipher padding not being deterministic and not covered by the Message Authentication Code
Vulnerability Detection Method Evaluate previous collected information about this service. Details: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability . ↔.. OID:1.3.6.1.4.1.25623.1.0.802087 Version used: 2020-08-24T15:18:35Z

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Summary

The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).

Vulnerability Detection Result

Server Temporary Key Size: 1024 bits

Impact

An attacker might be able to decrypt the SSL/TLS communication offline.

Solution:

Solution type: Workaround

Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group (see the references).

For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.

Vulnerability Insight

The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.

Vulnerability Detection Method

... continues on next page ...

...continued from previous page ...
<p>Checks the DHE temporary public key size. Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability. ↪.. OID:1.3.6.1.4.1.25623.1.0.106223 Version used: 2021-02-12T06:42:15Z</p>

<p>Medium (CVSS: 4.0) NVT: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm</p>
<p>Summary The remote service is using a SSL/TLS certificate in the certificate chain that has been signed using a cryptographically weak hashing algorithm.</p>
<p>Vulnerability Detection Result The following certificates are part of the certificate chain but using insecure ↪signature algorithms: Subject: 1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D626173 ↪652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complic ↪ation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thi ↪ng outside US,C=XX Signature Algorithm: sha1WithRSAEncryption</p>
<p>Solution: Solution type: Mitigation Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.</p>
<p>Vulnerability Insight The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use: - Secure Hash Algorithm 1 (SHA-1) - Message Digest 5 (MD5) - Message Digest 4 (MD4) - Message Digest 2 (MD2) Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates. NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive: Fingerprint1</p>

2.1.20 Medium 5432/tcp

Medium (CVSS: 5.8) NVT: SSL/TLS: OpenSSL CCS Man in the Middle Security Bypass Vulnerability
Summary OpenSSL is prone to security-bypass vulnerability.
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.
Impact Successfully exploiting this issue may allow attackers to obtain sensitive information by conducting a man-in-the-middle attack. This may lead to other attacks.
Solution: Solution type: VendorFix Updates are available. Please see the references for more information.
Affected Software/OS OpenSSL before 0.9.8za, 1.0.0 before 1.0.0m and 1.0.1 before 1.0.1h.
Vulnerability Insight OpenSSL does not properly restrict processing of ChangeCipherSpec messages, which allows man-in-the-middle attackers to trigger use of a zero-length master key in certain OpenSSL-to-OpenSSL communications, and consequently hijack sessions or obtain sensitive information, via a crafted TLS handshake, aka the 'CCS Injection' vulnerability.
Vulnerability Detection Method Send two SSL ChangeCipherSpec request and check the response.

NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Summary

It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.

Vulnerability Detection Result

In addition to TLSv1.0+ the service is also providing the deprecated SSLv3 protocol and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.8020 → 67) VT.

dfn-cert: DFN-CERT-2014-1354

Medium (CVSS: 4.3)

NVT: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection

Summary

It was possible to detect the usage of the deprecated TLSv1.0 and/or TLSv1.1 protocol on this system.

Vulnerability Detection Result

The service is only providing the deprecated TLSv1.0 protocol and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.802067) VT.

Impact

An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.

Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:

Solution type: Mitigation

It is recommended to disable the deprecated TLSv1.0 and/or TLSv1.1 protocols in favor of the TLSv1.2+ protocols. Please see the references for more information.

Affected Software/OS

All services providing an encrypted communication using the TLSv1.0 and/or TLSv1.1 protocols.

Vulnerability Insight

The TLSv1.0 and TLSv1.1 protocols contain known cryptographic flaws like:

- CVE-2011-3389: Browser Exploit Against SSL/TLS (BEAST)
- CVE-2015-0204: Factoring Attack on RSA-EXPORT Keys Padding Oracle On Downgraded Legacy Encryption (FREAK)

Vulnerability Detection Method

Check the used TLS protocols of the services provided by this system.

Details: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection

Medium (CVSS: 4.3) NVT: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability (POODLE)
Summary This host is prone to an information disclosure vulnerability.
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.
Impact Successful exploitation will allow a man-in-the-middle attackers gain access to the plain text data stream.
Solution: Solution type: Mitigation Possible Mitigations are: <ul style="list-style-type: none"> - Disable SSLv3 - Disable cipher suites supporting CBC cipher modes - Enable TLS_FALLBACK_SCSV if the service is providing TLSv1.0+
Vulnerability Insight The flaw is due to the block cipher padding not being deterministic and not covered by the Message Authentication Code
Vulnerability Detection Method Evaluate previous collected information about this service. Details: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability . ↪.. OID:1.3.6.1.4.1.25623.1.0.802087 Version used: 2020-08-24T15:18:35Z

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Summary

The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).

Vulnerability Detection Result

Server Temporary Key Size: 1024 bits

Impact

An attacker might be able to decrypt the SSL/TLS communication offline.

Solution:**Solution type:** Workaround

... continues on next page ...

...continued from previous page ...
<p>Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group (see the references).</p> <p>For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.</p>
<p>Vulnerability Insight</p> <p>The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.</p>
<p>Vulnerability Detection Method</p> <p>Checks the DHE temporary public key size.</p> <p>Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability. ↪...</p> <p>OID:1.3.6.1.4.1.25623.1.0.106223</p> <p>Version used: 2021-02-12T06:42:15Z</p>

2.1.21 Medium 22/tcp

<p>Medium (CVSS: 4.3)</p> <p>NVT: Weak Encryption Algorithm(s) Supported (SSH)</p>
<p>Summary</p> <p>The remote SSH server is configured to allow / support weak encryption algorithm(s).</p>
<p>Vulnerability Detection Result</p> <p>The remote SSH server supports the following weak client-to-server encryption algorithm(s):</p> <p>3des-cbc aes128-cbc aes192-cbc aes256-cbc arcfour arcfour128 arcfour256</p>
... continues on next page ...

...continued from previous page...
<pre> blowfish-cbc cast128-cbc rijndael-cbc@lysator.liu.se The remote SSH server supports the following weak server-to-client encryption al gorithms(s): 3des-cbc aes128-cbc aes192-cbc aes256-cbc arcfour arcfour128 arcfour256 blowfish-cbc cast128-cbc rijndael-cbc@lysator.liu.se </pre>
<p>Solution:</p> <p>Solution type: Mitigation</p> <p>Disable the reported weak encryption algorithm(s).</p>
<p>Vulnerability Insight</p> <ul style="list-style-type: none"> - The 'arcfour' cipher is the Arcfour stream cipher with 128-bit keys. The Arcfour cipher is believed to be compatible with the RC4 cipher [SCHNEIER]. Arcfour (and RC4) has problems with weak keys, and should not be used anymore. - The 'none' algorithm specifies that no encryption is to be done. Note that this method provides no confidentiality protection, and it is NOT RECOMMENDED to use it. - A vulnerability exists in SSH messages that employ CBC mode that may allow an attacker to recover plaintext from a block of ciphertext.
<p>Vulnerability Detection Method</p> <p>Checks the supported encryption algorithms (client-to-server and server-to-client) of the remote SSH server.</p> <p>Currently weak encryption algorithms are defined as the following:</p> <ul style="list-style-type: none"> - Arcfour (RC4) cipher based algorithms - none algorithm - CBC mode cipher based algorithms <p>Details: Weak Encryption Algorithm(s) Supported (SSH)</p> <p>OID:1.3.6.1.4.1.25623.1.0.105611</p> <p>Version used: 2021-09-20T08:25:27Z</p>

2.1.22 Medium 445/tcp

Medium (CVSS: 6.0) NVT: Samba MS-RPC Remote Shell Command Execution Vulnerability (Active Check)
Product detection result cpe:/a:samba:samba:3.0.20 Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)
Summary Samba is prone to a vulnerability that allows attackers to execute arbitrary shell commands because the software fails to sanitize user-supplied input.
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.
Impact An attacker may leverage this issue to execute arbitrary shell commands on an affected system with the privileges of the application.
Solution: Solution type: VendorFix Updates are available. Please see the referenced vendor advisory.
Affected Software/OS This issue affects Samba 3.0.0 to 3.0.25rc3.
Vulnerability Detection Method Send a crafted command to the samba server and check for a remote command execution. Details: Samba MS-RPC Remote Shell Command Execution Vulnerability (Active Check) OID:1.3.6.1.4.1.25623.1.0.108011 Version used: 2018-07-04T12:11:48Z
Product Detection Result Product: cpe:/a:samba:samba:3.0.20 Method: SMB NativeLanMan OID: 1.3.6.1.4.1.25623.1.0.102011)
References cve: CVE-2007-2447 bid: 23972 url: http://www.securityfocus.com/bid/23972 url: https://www.samba.org/samba/security/CVE-2007-2447.html

2.1.23 Medium 21/tcp

Medium (CVSS: 6.4) NVT: Anonymous FTP Login Reporting
Summary Reports if the remote FTP Server allows anonymous logins.
Vulnerability Detection Result It was possible to login to the remote FTP service with the following anonymous ↪account(s): anonymous:anonymous@example.com ftp:anonymous@example.com
Impact Based on the files accessible via this anonymous FTP login and the permissions of this account an attacker might be able to: - gain access to sensitive files - upload or delete files.
Solution: Solution type: Mitigation If you do not want to share files, you should disable anonymous logins.
Vulnerability Insight A host that provides an FTP service may additionally provide Anonymous FTP access as well. Under this arrangement, users do not strictly need an account on the host. Instead the user typically enters 'anonymous' or 'ftp' when prompted for username. Although users are commonly asked to send their email address as their password, little to no verification is actually performed on the supplied data.
Vulnerability Detection Method Details: Anonymous FTP Login Reporting OID:1.3.6.1.4.1.25623.1.0.900600 Version used: 2020-08-24T08:40:10Z
References url: https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-1999-0497

Medium (CVSS: 4.8) NVT: FTP Unencrypted Cleartext Login
Summary The remote host is running a FTP service that allows cleartext logins over unencrypted connections.
... continues on next page ...

...continued from previous page ...
Vulnerability Detection Result The remote FTP service accepts logins without a previous sent 'AUTH TLS' command ↩. Response(s): Non-anonymous sessions: 331 Please specify the password. Anonymous sessions: 331 Please specify the password.
Impact An attacker can uncover login names and passwords by sniffing traffic to the FTP service.
Solution: Solution type: Mitigation Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.
Vulnerability Detection Method Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command. Details: FTP Unencrypted Cleartext Login OID:1.3.6.1.4.1.25623.1.0.108528 Version used: 2020-08-24T08:40:10Z

[[return to 192.168.1.125](#)]

2.1.24 Medium 2121/tcp

Medium (CVSS: 4.8) NVT: FTP Unencrypted Cleartext Login
Summary The remote host is running a FTP service that allows cleartext logins over unencrypted connections.
Vulnerability Detection Result The remote FTP service accepts logins without a previous sent 'AUTH TLS' command ↩. Response(s): Non-anonymous sessions: 331 Password required for openvasvt Anonymous sessions: 331 Password required for anonymous
Impact An attacker can uncover login names and passwords by sniffing traffic to the FTP service.
Solution: Solution type: Mitigation

[\[return to 192.168.1.125 \]](#)

2.1.25 Medium 80/tcp

Medium (CVSS: 6.8) NVT: TWiki Cross-Site Request Forgery Vulnerability - Sep10
Summary The host is running TWiki and is prone to Cross-Site Request Forgery vulnerability.
Vulnerability Detection Result Installed version: 01.Feb.2003 Fixed version: 4.3.2
Impact Successful exploitation will allow attacker to gain administrative privileges on the target application and can cause CSRF attack.
Solution: Solution type: VendorFix Upgrade to TWiki version 4.3.2 or later.
Affected Software/OS TWiki version prior to 4.3.2
Vulnerability Insight Attack can be done by tricking an authenticated TWiki user into visiting a static HTML page on another side, where a Javascript enabled browser will send an HTTP POST request to TWiki, which in turn will process the request as the TWiki user.
Vulnerability Detection Method Details: TWiki Cross-Site Request Forgery Vulnerability - Sep10 OID:1.3.6.1.4.1.25623.1.0.801281
... continues on next page ...

...continued from previous page ...
Version used: 2019-01-07T06:54:36Z

Medium (CVSS: 6.1) NVT: jQuery < 1.9.0 XSS Vulnerability
Summary jQuery is vulnerable to Cross-site Scripting (XSS) attacks.
Vulnerability Detection Result ... continues on next page ...

...continued from previous page ...	
Installed version: 1.3.2 Fixed version: 1.9.0 Installation path / port: /mutillidae/javascript/ddsmoothmenu	
Solution: Solution type: VendorFix Update to version 1.9.0 or later.	
Affected Software/OS jQuery prior to version 1.9.0.	
Vulnerability Insight The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common.	
Vulnerability Detection Method Checks if a vulnerable version is present on the target host. Details: jQuery < 1.9.0 XSS Vulnerability OID:1.3.6.1.4.1.25623.1.0.141636 Version used: 2021-06-11T08:43:18Z	
References cve: CVE-2012-6708 url: https://bugs.jquery.com/ticket/11290 cert-bund: CB-K18/1131 dfn-cert: DFN-CERT-2020-0590	
Medium (CVSS: 6.0) NVT: TWiki Cross-Site Request Forgery Vulnerability	
Summary The host is running TWiki and is prone to Cross-Site Request Forgery Vulnerability.	
Vulnerability Detection Result Installed version: 01.Feb.2003 Fixed version: 4.3.1	
Impact Successful exploitation will allow attacker to gain administrative privileges on the target application and can cause CSRF attack.	
... continues on next page ...	

...continued from previous page ...
Solution: Solution type: VendorFix Upgrade to version 4.3.1 or later.
Affected Software/OS TWiki version prior to 4.3.1
Vulnerability Insight Remote authenticated user can create a specially crafted image tag that, when viewed by the target user, will update pages on the target system with the privileges of the target user via HTTP requests.
Vulnerability Detection Method Details: TWiki Cross-Site Request Forgery Vulnerability OID:1.3.6.1.4.1.25623.1.0.800400 Version used: 2019-01-07T06:54:36Z

Medium (CVSS: 5.8) NVT: HTTP Debugging Methods (TRACE/TRACK) Enabled
Summary The remote web server supports the TRACE and/or TRACK methods. TRACE and TRACK are HTTP methods which are used to debug web server connections.
Vulnerability Detection Result The web server has the following HTTP methods enabled: TRACE
Impact An attacker may use this flaw to trick your legitimate web users to give him their credentials.
Solution: Solution type: Mitigation Disable the TRACE and TRACK methods in your web server configuration. Please see the manual of your web server or the references for more information.
Affected Software/OS ... continues on next page ...

...continued from previous page...

Web servers with enabled TRACE and/or TRACK methods.

Vulnerability Insight

It has been shown that web servers supporting this methods are subject to cross-site-scripting attacks, dubbed XST for Cross-Site-Tracing, when used in conjunction with various weaknesses in browsers.

Vulnerability Detection Method

Checks if HTTP methods such as TRACE and TRACK are enabled and can be used.

Details: HTTP Debugging Methods (TRACE/TRACK) Enabled

Medium (CVSS: 5.0) NVT: awiki Multiple Local File Include Vulnerabilities
Summary awiki is prone to multiple local file-include vulnerabilities because it fails to properly sanitize user-supplied input.
Vulnerability Detection Result Vulnerable URL: http://192.168.1.125/mutillidae/index.php?page=/etc/passwd
Impact An attacker can exploit this vulnerability to obtain potentially sensitive information and execute arbitrary local scripts in the context of the webserver process. This may allow the attacker to compromise the application and the host. Other attacks are also possible.
Solution: Solution type: WillNotFix No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.
Affected Software/OS awiki 20100125 is vulnerable. Other versions may also be affected.
Vulnerability Detection Method Details: awiki Multiple Local File Include Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.103210 Version used: 2021-04-16T06:57:08Z

Medium (CVSS: 5.0) NVT: /doc directory browsable
Summary The /doc directory is browsable. /doc shows the content of the /usr/doc directory and therefore it shows which programs and - important! - the version of the installed programs.
Vulnerability Detection Result Vulnerable URL: http://192.168.1.125/doc/
Solution: ... continues on next page ...

...continued from previous page ...
Solution type: Mitigation Use access restrictions for the /doc directory. If you use Apache you might use this in your access.conf: <pre><Directory /usr/doc> AllowOverride None order deny, allow deny from all allow from localhost </Directory></pre>
Vulnerability Detection Method Details: /doc directory browsable OID:1.3.6.1.4.1.25623.1.0.10056 Version used: 2020-08-24T15:18:35Z
References cve: CVE-1999-0678 bid: 318

Medium (CVSS: 4.8) NVT: Cleartext Transmission of Sensitive Information via HTTP
Summary The host / application transmits sensitive information (username, passwords) in cleartext via HTTP.
Vulnerability Detection Result The following input fields where identified (URL:input name): <pre>http://192.168.1.125/phpMyAdmin/:pma_password http://192.168.1.125/phpMyAdmin/?D=A:pma_password http://192.168.1.125/tikiwiki/tiki-install.php:pass http://192.168.1.125/twiki/bin/view/TWiki/TWikiUserAuthentication:oldpassword</pre>
Impact An attacker could use this situation to compromise or eavesdrop on the HTTP communication between the client and the server using a man-in-the-middle attack to get access to sensitive data like usernames or passwords.
Solution: Solution type: Workaround Enforce the transmission of sensitive data via an encrypted SSL/TLS connection. Additionally make sure the host / application is redirecting all users to the secured SSL/TLS connection before allowing to input sensitive data into the mentioned functions.
Affected Software/OS Hosts / applications which doesn't enforce the transmission of sensitive data via an encrypted SSL/TLS connection.
... continues on next page ...

...continued from previous page ...
Vulnerability Detection Method Evaluate previous collected information and check if the host / application is not enforcing the transmission of sensitive data via an encrypted SSL/TLS connection. The script is currently checking the following: - HTTP Basic Authentication (Basic Auth) - HTTP Forms (e.g. Login) with input field of type 'password' Details: Cleartext Transmission of Sensitive Information via HTTP OID:1.3.6.1.4.1.25623.1.0.108440 Version used: 2020-08-24T15:18:35Z

Medium (CVSS: 4.3) NVT: phpMyAdmin 'error.php' Cross Site Scripting Vulnerability
Summary The host is running phpMyAdmin and is prone to Cross-Site Scripting Vulnerability.
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.
Impact Successful exploitation will allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.
Solution: Solution type: WillNotFix No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.
Affected Software/OS phpMyAdmin version 3.3.8.1 and prior.
Vulnerability Insight The flaw is caused by input validation errors in the 'error.php' script when processing crafted BBcode tags containing '@' characters, which could allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.
Vulnerability Detection Method Details: phpMyAdmin 'error.php' Cross Site Scripting Vulnerability

Medium (CVSS: 4.3) NVT: Apache HTTP Server 'httpOnly' Cookie Information Disclosure Vulnerability
Product detection result cpe:/a:apache:http_server:2.2.8 Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1 ↪.0.117232)
Summary Apache HTTP Server is prone to a cookie information disclosure vulnerability.
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.
Impact Successful exploitation will allow attackers to obtain sensitive information that may aid in further attacks.
Solution: Solution type: VendorFix Update to Apache HTTP Server version 2.2.22 or later.
Affected Software/OS Apache HTTP Server versions 2.2.0 through 2.2.21.
Vulnerability Insight The flaw is due to an error within the default error response for status code 400 when no custom ErrorDocument is configured, which can be exploited to expose 'httpOnly' cookies.

NVT: VNC Server Unencrypted Data Transmission

Summary

The remote host is running a VNC server providing one or more insecure or cryptographically weak Security Type(s) not intended for use on untrusted networks.

Vulnerability Detection Result

The VNC server provides the following insecure or cryptographically weak Security Type(s):

2 (VNC authentication)

Impact

An attacker can uncover sensitive data by sniffing traffic to the VNC server.

Solution:**Solution type:** Mitigation

Run the session over an encrypted channel provided by IPsec [RFC4301] or SSH [RFC4254]. Some VNC server vendors are also providing more secure Security Types within their products.

Vulnerability Detection Method

Details: VNC Server Unencrypted Data Transmission

OID:1.3.6.1.4.1.25623.1.0.108529

Version used: 2020-11-10T09:46:51Z

2.1.28 Low general/tcp

Low (CVSS: 2.6) NVT: TCP timestamps
Summary The remote host implements TCP timestamps and therefore allows to compute the uptime.
Vulnerability Detection Result It was detected that the host implements RFC1323/RFC7323. The following timestamps were retrieved with a delay of 1 seconds in-between: Packet 1: 597847 Packet 2: 597955
Impact A side effect of this feature is that the uptime of the remote host can sometimes be computed.
Solution: Solution type: Mitigation To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime. To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled' Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled. The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment. See the references for more information.
Affected Software/OS TCP implementations that implement RFC1323/RFC7323.
Vulnerability Insight The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.
Vulnerability Detection Method Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported. Details: TCP timestamps OID:1.3.6.1.4.1.25623.1.0.80091 Version used: 2020-08-24T08:40:10Z

2.1.29 Low 22/tcp

Low (CVSS: 2.6) NVT: Weak MAC Algorithm(s) Supported (SSH)
<p>Summary</p> <p>The remote SSH server is configured to allow / support weak MAC algorithm(s).</p>
<p>Vulnerability Detection Result</p> <p>The remote SSH server supports the following weak client-to-server MAC algorithm \hookrightarrow(s):</p> <p>hmac-md5 hmac-md5-96 hmac-sha1-96</p> <p>The remote SSH server supports the following weak server-to-client MAC algorithm \hookrightarrow(s):</p> <p>hmac-md5 hmac-md5-96 hmac-sha1-96</p>
<p>Solution:</p> <p>Solution type: Mitigation</p> <p>Disable the reported weak MAC algorithm(s).</p>
<p>Vulnerability Detection Method</p> <p>Checks the supported MAC algorithms (client-to-server and server-to-client) of the remote SSH server.</p> <p>Currently weak MAC algorithms are defined as the following:</p> <ul style="list-style-type: none"> - MD5 based algorithms - 96-bit based algorithms - none algorithm <p>Details: Weak MAC Algorithm(s) Supported (SSH) OID:1.3.6.1.4.1.25623.1.0.105610 Version used: 2021-09-20T11:05:40Z</p>
